

GLOBAL WARMING

'Global warming' almost every day we hear this word. It is not a prediction of some people, but it is a gradual phenomenon that next generation has to face. It means the rise in temperature of the Earth. This refers to the damages humans are causing to the atmosphere .The ozone layer that protects us from the Sun's ultraviolet rays is being destroyed by the CFC'S (Chloro Fluoro Carbons) that humans use .CFC's destroy ozone molecules .

Global warming has caused many disturbances such as increase in temperature, melting of many glaciers etc. The increased heat can be felt in many countries like Libya, Kuwait, U.A.E and many other places too. The temperatures in these places have increased so much compared with 2010. If the heat increases at this rate, soon it will be impossible for humans to live in such places by 2050. It is not just the CFC's that cause global warming. Cutting of trees are the main reason for global warming as, trees and small plants absorb the greenhouse gas (Carbon dioxide) to make food. Carbon dioxide causes holes or spaces to form on the surface of the ozone layer which lets more ultraviolet rays to enter the surface of the Earth. Smoke, just like the carbon dioxide, also destroys the ozone layer.

In order to stop the life threatening effects of the global warming, we should take a permanent break from all the bad habits causing increase in the Carbon dioxide level and other greenhouse gases leading to the greenhouse effect have by warming of the earth surface. We should stop deforestation, lessen the use of electricity from minerals; stop the burning of wood, etc to save our planet.
